Signal Transduction and Bacterial Virulence -PCVolcan

In order to survive, bacteria must constantly monitor their structure and physiology. Adaptive behaviours are established by using environmental sensors and response regulators.

9 Signal Transduction in Bacteria | The Markey Scholars ...

A majority of signal transduction in bacteria is mediated by phosphotransfer signaling systems, commonly referred to as two-component signal transduction pathways. These systems involve two conserved protein components. The first component is a histidine protein kinase that autophosphorylates at a histidine residue, creating a high-energy phosphoryl group that is poised for transfer to Signal transduction - Wikipedia

Signal transduction is the process by which a chemical or physical signal is transmitted through a cell as a series of molecular events, most commonly protein phosphorylation catalyzed by protein kinases, which ultimately results in a cellular response.
