Bleed air pressure out of the water tank, or add air pressure into the water tank, until the tank pressure is at the desired set-pressure. For example, if your well pump pressure control switch is set to "cut in" (start pumping water from the well) at 30 psi, then set the pressure tank to  $(30 - 2) = 28$  psi.

In the pressure tank, compressed air bears down on the water in the tank. When a valve, such as a faucet, is turned on in the house, the pressure in the tank pushes the water out of the tank, through the plumbing and out of the faucet.

#### **Troubleshooting a bladder pressure tank**

A bladder pressure tank contains pressurized air and water separated by a flexible membrane (bladder). These tanks are typically precharged with air at the factory. As water pressure changes, the volume of air in a bladder tank contracts and expands. Periodically, the amount of air in the tank
